

Complications of tuberculosis

58-year-old woman complains of dizziness, weakness, and losing 14 kg within 2 months. The patient has a past history of tuberculosis. Objectively, she presents with increased skin pigmentation, body weight deficit of 10 kg, and blood pressure of 90/55 mm Hg. Blood test revealed the following: Na — 117 mmol/L, K — 6.4 mmol/L, Cl — 116 mmol/L, $[\text{HCO}_3^-]$ — 27 mEq/L, glucose — 2.9 mmol/l.

What is the most likely diagnosis in this case?

58-year-old woman complains of **dizziness, weakness, and losing 14 kg within 2 months**. The patient **has a past history of tuberculosis**. Objectively, she presents with **increased skin pigmentation, body weight deficit of 10 kg, and blood pressure of 90/55 mm Hg**. Blood test revealed the following: **Na — 117 mmol/L, K — 6.4 mmol/L, Cl — 116 mmol/L, [HCO₃⁻] — 27 mEq/L, glucose — 2.9 mmol/l**.

What is the most likely **diagnosis** in this case?

- Chronic renal insufficiency
- Good pasture syndrome
- Adrenal insufficiency
- Renal vein thrombosis
- ACTH-secreting tumor

58-year-old woman complains of **dizziness, weakness, and losing 14 kg within 2 months**. The patient **has a past history of tuberculosis**. Objectively, she presents with **increased skin pigmentation, body weight deficit of 10 kg, and blood pressure of 90/55 mm Hg**. Blood test revealed the following: **Na — 117 mmol/L, K — 6.4 mmol/L, Cl — 116 mmol/L, [HCO₃⁻] — 27 mEq/L, glucose — 2.9 mmol/l**.

What is the most likely **diagnosis** in this case?

- Chronic renal insufficiency
- Good pasture syndrome
- **Adrenal insufficiency**
- Renal vein thrombosis
- ACTH-secreting tumor

A patient has been diagnosed with right-sided pneumothorax and prescribed urgent drainage of the pleural cavity.

What site should be used for the pleural tap in this case?

A patient has been diagnosed with right-sided **pneumothorax** and prescribed urgent **drainage of the pleural cavity**.

What **site** should be used **for the pleural tap** in this case?

- The sixth intercostal space, on the posterior axillary line
- The seventh intercostal space, on the scapular line
- The projection of the pleural sinus
- The second intercostal space, on the midclavicular line
- The site of the largest percussion dullness

A patient has been diagnosed with right-sided **pneumothorax** and prescribed urgent **drainage of the pleural cavity**.

What **site** should be used **for the pleural tap** in this case?

- The sixth intercostal space, on the posterior axillary line
- The seventh intercostal space, on the scapular line
- The projection of the pleural sinus
- **The second intercostal space, on the midclavicular line**
- The site of the largest percussion dullness

During physical exercises, a 32-year-old patient suddenly felt lack of air, weakness, chest pain on the right that radiated into the right shoulder, shortness of breath, and palpitations. Objectively, the patient's condition is severe, tachycardia is up to 100/min., blood pressure — 90/60 mm Hg, respiratory rate — 28/min., the right half of the chest lags behind during breathing. Percussion detects tympanic sound on the right, no respiratory sounds were detected there. The body temperature is normal.

What is the most likely diagnosis in this case?

During physical exercises, a 32-year-old patient suddenly felt lack of air, weakness, chest pain on the right that radiated into the right shoulder, shortness of breath, and palpitations. Objectively, the patient's condition is severe, tachycardia is up to 100/min., blood pressure — 90/60 mm Hg, respiratory rate — 28/min., the right half of the chest lags behind during breathing. Percussion detects tympanic sound on the right, no respiratory sounds were detected there. The body temperature is normal.

What is the most likely diagnosis in this case?

- Spontaneous pneumothorax
- Myocardial infarction
- Pulmonary infarction
- Vascular collapse
- Pneumonia

During physical exercises, a 32-year-old patient suddenly felt lack of air, weakness, chest pain on the right that radiated into the right shoulder, shortness of breath, and palpitations. Objectively, the patient's condition is severe, tachycardia is up to 100/min., blood pressure — 90/60 mm Hg, respiratory rate — 28/min., the right half of the chest lags behind during breathing. Percussion detects tympanic sound on the right, no respiratory sounds were detected there. The body temperature is normal.

What is the most likely diagnosis in this case?

- Spontaneous pneumothorax
- Myocardial infarction
- Pulmonary infarction
- Vascular collapse
- Pneumonia

During physical exertion, a 28-yearold man suddenly developed dyspnea, weakness, palpitations, and chest pain on the right that was radiating into the right shoulder. Objectively, his condition is severe, tachycardia — 100/min., respiratory rate — 28/min. The right half of the chest lags behind in the act of breathing. Percussion produces a tympanic sound over the lungs on the right. Respiratory sounds cannot be auscultated. Body temperature — 36.7°C.

What is the most likely diagnosis in this case?

During physical exertion, a 28-yearold man suddenly developed dyspnea, weakness, palpitations, and chest pain on the right that was radiating into the right shoulder. Objectively, his condition is severe, tachycardia — 100/min., respiratory rate — 28/min. The right half of the chest lags behind in the act of breathing. Percussion produces a tympanic sound over the lungs on the right. Respiratory sounds cannot be auscultated. Body temperature — 36.7°C.

What is the most likely diagnosis in this case?

- Myocardial infarction
- Lung abscess
- Empyema of the pleural cavity
- Spontaneous pneumothorax
- Mediastinitis

During physical exertion, a 28-yearold man suddenly developed dyspnea, weakness, palpitations, and chest pain on the right that was radiating into the right shoulder. Objectively, his condition is severe, tachycardia — 100/min., respiratory rate — 28/min. The right half of the chest lags behind in the act of breathing. Percussion produces a tympanic sound over the lungs on the right. Respiratory sounds cannot be auscultated. Body temperature — 36.7°C.

- Myocardial infarction
- Lung abscess
- Empyema of the pleural cavity
- Spontaneous pneumothorax
- Mediastinitis

A 34-year-old man has been suffering from pulmonary tuberculosis for the last 7 years. He complains of muscle weakness, weight loss, diarrhea, and frequent urination. Objectively, his skin, gums, and buccal mucosa are hyperpigmented. His blood pressure is 90/58 mm Hg. In the blood: erythrocytes – $3.1 \cdot 10^{12}/L$, Hb – 95 g/L, color index – 0.92; leukocytes – $9.4 \cdot 10^9/L$, eosinophils – 7%, segmented neutrophils – 45%, band neutrophils – 1%, lymphocytes – 40%, monocytes – 7%, Na^+ – 115 mmol/L, K^+ – 7.3 mmol/L.

Make the diagnosis:

A 34-year-old man has been suffering from pulmonary tuberculosis for the last 7 years. He complains of muscle weakness, weight loss, diarrhea, and frequent urination. Objectively, his skin, gums, and buccal mucosa are hyperpigmented. His blood pressure is 90/58 mm Hg. In the blood: erythrocytes – $3.1 \cdot 10^{12}/L$, Hb – 95 g/L, color index – 0.92; leukocytes – $9.4 \cdot 10^9/L$, eosinophils – 7%, segmented neutrophils – 45%, band neutrophils – 1%, lymphocytes – 40%, monocytes – 7%, Na^+ – 115 mmol/L, K^+ – 7.3 mmol/L.

Make the diagnosis:

- Pheochromocytoma
- Primary hyperaldosteronism
- Congenital hyperplasia of the adrenal cortex
- Primary insufficiency of the adrenal cortex
- Diabetes insipidus

- Congenital hyperplasia of the adrenal cortex
- Primary insufficiency of the adrenal cortex
- Diabetes insipidus

A 28-year-old man is undergoing a treatment for pulmonary tuberculosis. He complains of shortness of breath and a sharp chest pain on the right that appeared suddenly. Percussion detects a bandbox resonance over the right lung, auscultation detects no breathing there. X-ray shows that the right lung is collapsed to its root by 1/2 of its volume, the heart and mediastinal organs are shifted to the left.

What complication has developed in this patient?

A 28-year-old man is undergoing a treatment for pulmonary tuberculosis. He complains of shortness of breath and a sharp chest pain on the right that appeared suddenly. Percussion detects a bandbox resonance over the right lung, auscultation detects no breathing there. X-ray shows that the right lung is collapsed to its root by 1/2 of its volume, the heart and mediastinal organs are shifted to the left.

What complication has developed in this patient?

- Dry pleurisy
- Spontaneous pneumothorax
- Pleural empyema
- Pulmonary infarction
- Exudative pleurisy
